Versa
VersaPhi®
Botulinum A Toxin

VersaPhi® *Botulinum A Toxin*

VersaPhi® is a sterile, high-purity formulation containing Botulinum Toxin Type A, developed for both therapeutic and aesthetic medical applications.
The product is administered via intramuscular injection and is indicated for the management of conditions associated with muscle hyperactivity or spasm.
VersaPhi® is manufactured using advanced pharmaceutical technologies under (GMP) standards. All stages of production are conducted under rigorous multi-layer quality control systems to ensure product consistency, purity, and safety.

Key Advantages of VersaPhi®

- Controlled diffusion profile, minimizing the risk of unintended toxin spread.
- Preservation of natural facial expression, reducing the likelihood of a “frozen face” appearance.
- Predictable and consistent clinical response throughout the treatment cycle.
- Uniform therapeutic performance, supporting accurate facial symmetry correction.
- Suitable for precise and layered injection techniques.
- High safety profile in both therapeutic and aesthetic indications.
- Rapid onset with controllable clinical effect.
- Improvement in skin quality and muscular appearance.

Onset of Action and Duration of Effect

The clinical effect of **VersaPhi®** typically becomes apparent within 3–5 days following injection, with peak therapeutic effect occurring approximately 10–14 days post–treatment.
The duration of effect may vary depending on the treatment area, administered dose, and individual patient characteristics, with an average duration of 3–6 months. Repeat administration may be considered to maintain therapeutic or aesthetic outcomes.

Patient Selection

VersaPhi® treatment may be performed as a stand–alone procedure or in combination with other aesthetic modalities, including dermal fillers and adjunctive therapies, to enhance overall treatment outcomes. Final patient eligibility and treatment planning should be determined by a qualified physician following comprehensive clinical evaluation.

Clinical Indications

Aesthetic Indications:

- Glabellar lines and forehead rhytides
- Lateral canthal lines (Crow's feet)
- Nasal wrinkles (Bunny lines)
- Perioral and lip lines
- Gummy smile correction
- Platysmal band reduction
- Brow lift and oral commissure lift
- Microbotox techniques for improvement of skin texture, pore size, and overall skin quality

Therapeutic Indications:

- Primary hyperhidrosis (axillary, palmar, and plantar)
- Blepharospasm and hemifacial spasm
- Cervical dystonia
- Focal spasticity
- Bruxism
- Chronic migraine

Precautions

- Administration must be performed exclusively by trained and qualified physicians.
- Patients are advised to avoid strenuous physical activity for at least 24 hours following injection.
- Particular caution is required when treating areas involving muscles responsible for swallowing or respiration.
- Temporary localized reactions such as swelling, erythema, or mild bruising may occur and typically resolve spontaneously.
- Use with caution in patients with underlying neuromuscular disorders.

Contraindications

VersaPhi® should not be administered in the following situations:

- Known hypersensitivity to Botulinum Toxin Type A or any component of the formulation.
- Active infection at the proposed injection site.
- Uncontrolled neuromuscular disorders.
- Pregnancy and lactation, unless deemed appropriate by the treating physician.
